A Memorandum to the State of Israel advising a ceasefire and temporary withdrawal from the Gaza Strip for strategic purposes
By Anthony of Boston

As an individual that has been following the conflict since 2017, even developing an algorithm for predicting when the highest escalation of rocket attacks within a given calendar year would occur against Israel, I strongly urge Israel to not waste its resources in a war of attrition with terrorists in Lebanon as well as in Iraq, Syria, and Iran. Why? Because I can ascertain that a greater attack against Israel is already planned for the period between June 5, 2025 and September 4th 2025. What is the significance of that period? Well, back in 2019, I discovered that the enemies of Israel were carrying out attacks in a way in which it could easily be predicted when they would decide to dial up the intensity of those attacks. The parameters that I applied in predicting when the highest intensity of rocket attacks against Israel would take place within a given calendar year involved observing the lunar nodes and the planet Mars. The lunar nodes are the intersecting points between the orbit of the moon around the earth and the orbital plane of the earth in its revolution around the sun. It appears that when Mars is within 30 degrees of either of those points(the lunar nodes) within a calendar year, one can predict the timeframe of which the highest concentration of rocket fire would be carried out by terrorists against Israel, relative to the rest of the year. I discovered this in 2019 and then demonstrated in real time how it applied. So, the primary parameter is when Mars undergoes a full phase of being within 30 degrees of the lunar node within a calendar year (Between January and December), one can predict that the corresponding timeframe, which is usually a 3 – 3.5 month period, will be the time that the highest concentration or intensity of rocket fire will be carried out. In 2020, Mars was within 30 degrees of the lunar node between January 15th and April 3rd. According to the data, that period covered the highest concentration of rocket fire against Israel compared to the entire year of 2020. About 115 rockets were fired in that time, and that number exceeded the amount fired at any other time in 2020. In 2021, Mars did a full phase of being within 30 degrees of the lunar node between February 9th and May 13th. Over 4000 rockets were fired at Israel near the end of that phase and of course that number exceeded the amount of rockets fired at any other time in 2021. In 2022, Mars did a full phase of being within 30 degrees of the lunar node within the calendar year between June 22nd and September 19th. Around 1100 rockets were fired at Israel within that timeframe in early August, and that number exceeded the amount fired at the other time in the year 2022. In 2023, Mars completed a full phase of being within 30 degrees of the lunar node between August 24th and November 15th, and during that time, terrorists fired 10,000 rockets at Israel, and that number exceeded the amount fired at any other time in the year 2023. In 2024, Mars underwent a full phase of being within 30 degrees of the lunar node between April 12th and June 25th. During that time, terrorists fired close to 3500 rockets, which has already exceeded the amount fired at any other time in 2024. In 2025, Mars will be within 30 degrees of the lunar node between June 5, 2025 and September 4th 2025, and after having seen the results of applying this algorithm in the years past, with planned attacks expanding year after year in terms of number of rockets and terror participants, we can expect that the highest concentration of rocket fire against Israel in 2025 will occur within that timeframe of June 5th and September 4th. Based on the data, we can anticipate that the scope and scale of rocket attacks will be even greater than the expansion that happened in 2023 and 2024 respectively, with Hamas having fired 10,000 rockets, along with Hezbollah and Iran joining the axis and also carrying out scores of unprecedented missile attacks. In 2025, it should be expected that terror efforts will continue to expand, with a concerted attempt by the axis to seize territory from Israel, which would be the first time that Israel has lost territory since its establishment as a state in 1948. Here we can surmise that the axis's goal is to deplete Israel of resources from now until next year via attrition, before launching a major attack between June 5th 2025 and September 4th 2025, one that will attempt to seize territory from Israel in another unprecedented assault. Thus, Israel should end the attrition and prepare for the major assault of 2025 to occur between June 5th and September 4th.

Based on the data, negotiations and a ceasefire deal has to be confirmed immediately. The deal will involve declaring defeat of Hamas, as well as Israeli withdrawal from the Gaza strip in exchange for release of all Israeli hostages. In the north, Israel would

agree to stop the assassination operations and airstrikes if Hezbollah stops firing missiles and drones into Israel. This deal would be brokered by the US, under a secret agreement that the US agree to increase military aid to Israel in preparation for a major coordinated multi-national attack on Israeli soil between June 5th 2025 and September 4th 2025, an attack that will attempt to seize territory in Israel.
